(54) ANTENNA FOR PORTABLE RADIO EQUIPMENT

(57)Abstract:

PROBLEM TO BE SOLVED: To provide an antenna for portable radio equipment, capable of further improving performance.**SOLUTION:** The portable radio equipment 1 is provided with a ring shape composed of a ring part 2 and a pedestal part 3, the ring part 2 is provided with a slot antenna 10 and the pedestal part 3 is provided with a pattern antenna 11 as another antenna element. Relating to the pattern antenna 1, a conductor is formed on the entire back surface of an insulation substrate, and an antenna pattern in a belt shape is extended on the front surface of the insulation substrate. In the slot antenna 10, copper foil is formed through an adhesive layer on a flexible substrate forming the belt shape and a slot (groove) is formed at the copper foil. The output of a transmission circuit 9 is connected in parallel with the pattern antenna 11 and the slot antenna 10.**LEGAL STATUS**

Abstract (Basic): JP 2001053521 A

NOVELTY - Several slots are distributed continuously on the antenna substrate. The length of slot is set relevant to the communication frequency.

USE - For portable radio e.g. wristwatch mounted type radio .

ADVANTAGE - Performance of antenna is enhanced, thereby facilitates usage in wireless communication.

DESCRIPTION OF DRAWING(S) - The figure shows the portable radio using antenna .

?

portable radio equipment.

SOLUTION: In the antenna for portable radio equipment to be used, while being mounted or held on a human body, an antenna element is configured by locating a shielding plate 4 inside a casing, which is tightly adhered on the human body, and electrostatically coupled in with the human body. Furthermore, the cover of a battery 1 provided inside the casing is used as an antenna element, and an electric field type dipole antenna is formed from these elements. Since the shielding plate 4 is electrostatically coupled via the casing to the human body, human body can be utilized as a part of antenna elements and antenna efficiency can be improved.

ABSTRACT EP 1422853 A1

A **radio** transmission system is configured to, on the occasion of
radio transmission of information between a transmitter and a receiver,
perform the **radio** transmission of information using an orthogonal
frequency and code division multiplexing transmission scheme of
parallelly transmitting identical information by a plurality of
sub-carriers. The **radio** transmission system has a spreading factor
variable control transmitting device for parallelly converting
information channel-coded at the transmitter, according to symbols
transmitted simultaneously, and for spreading a sequence of parallelized
symbols in at least one of a frequency direction and a time direction by
a spreading code sequence of a designated spreading factor.

ABSTRACT EP 901000 A2

A message processing device is adapted to obtain text data and read aloud the text data aloud by using a voice synthesizer. A loudspeaker device (16) is connected to the message processing device to output or read aloud the text data. The text data can be received through a receiving device (11) that receives outside information data or e-mail message data. The voice synthesizer (17) can be controlled by an outside information controller (13), with the outside information controller being able to distinguish senders of the text data and being able to select one voice tone data to read aloud messages sent by one sender. If the controller (13) recognizes that there are other messages sent by another sender, the controller (13) allots different voice tone data for the other sender's messages. The message processing device (33) can include a voice navigation device (34) to generate voice signals for giving route guidance messages or information to a driver of a vehicle. The voice tone used for the route guidance message is preferably different from the voice tone used to read aloud the outside information message. It is thus possible for the driver to recognize the source or senders of different messages being read aloud. It is also possible to

adjust the output timing of the route guidance message and the outside information message.

Abstract (Basic): US 20020030630 A1

NOVELTY - A battery (1) and a shielding plate (4) are accommodated in a casing to form the electric field dipole antenna . The shield plate is capacitively coupled with a human body (6) so that the human body forms an element of the antenna .

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for method of transmitting radio signal.

USE - For portable radio communication device.

ADVANTAGE - Since human body is used as an element of the antenna
